The problem

Learners can find information online—but turning it into practical, job-relevant skills is still difficult.

01 **Resources feel scattered**

02 **Too little guided practice**

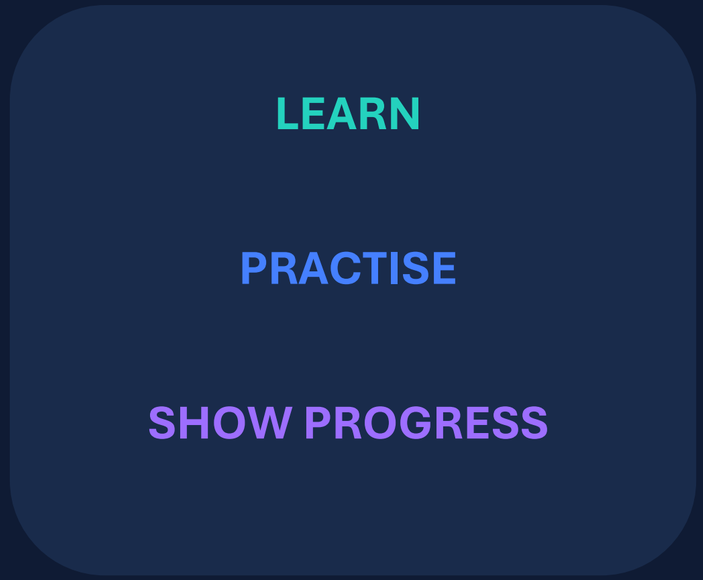

03 **Progress is hard to prove**

Working hypothesis: validate these pain points with interviews before claiming market-wide demand.

A clearer path from learning to doing

SkillBridge brings learning resources, practice and progress into one guided experience.

- Curated learning paths that help learners know what to study next.
- Short practical exercises that turn concepts into useful skills.
- Progress tracking so learners can see what they have completed.
- A mobile-friendly experience designed to be approachable and affordable.

A simple learner journey

The first version focuses on the core experience, not a long list of features.

1

Choose a path

Select a topic or skill goal.

2

Learn in small steps

Follow short lessons and examples.

3

Practise

Complete quizzes or mini-projects.

4

Track progress

Review completed work and next steps.

MVP idea: start with one learning path and test it with a small group before building more.

Start with a focused first audience

Initial audience hypothesis — confirm it through interviews and a small pilot.

PRIMARY AUDIENCE

Students and early-career learners

People building practical digital skills for study, work or a career change.

PILOT GEOGRAPHY

Begin in Kenya

Recruit a small test group through learning communities, peers and local networks.

Interview 10–15 potential learners to check their needs, current alternatives and willingness to pay.

Build the estimate from evidence

Do not present invented market figures. Add sourced data after defining the audience and geography.

TAM

All learners who could benefit from the category.

SAM

The part you can serve with your first product and geography.

SOM

The realistic share you could reach in the near term.

Next: find credible education / digital-skills data for Kenya, cite the sources, then show the assumptions and calculation.

Learners already have alternatives

This is an initial landscape to investigate—not a claim that all options are direct competitors.

Free online content

YouTube, blogs and tutorials

Low cost; less structured guidance

MOOCs / course sites

Online course platforms

Structured courses; practice and support vary

Bootcamps / tutors

Paid cohorts and one-to-one help

More guidance; often higher cost

Schools / colleges

Formal learning providers

Recognised learning; schedules can be less flexible

Research 3–5 specific alternatives and compare price, learning support, practical work and accessibility.

Make practical progress the difference

Potential differentiators to test with learners—not yet proven advantages.

- A guided next step instead of an overwhelming list of resources.
- Practice tasks and mini-projects linked to each learning path.
- Visible progress that helps learners understand what they can do.
- Affordable, mobile-friendly access for learners with limited budgets.

CORE PROMISE

Learn it.
Practise it.
Show it.

Validate by testing a prototype against the alternatives learners use today.

Be transparent about the stage

Current stage: concept / first draft. No user numbers or results are being claimed.

MONTHS 0–2

Discover

Interview learners; choose one learning path; sketch the MVP.

MONTHS 3–4

Pilot

Build a simple prototype; test with a small learner group.

MONTHS 5–6

Improve

Use feedback to improve lessons, practice and progress tracking.

Milestones and dates are proposed planning targets; adjust them to match your actual progress and capacity.

Test a simple freemium model

Possible revenue streams to validate; pricing has not yet been set.

FREE

Starter lessons and basic progress tracking

PREMIUM

Subscription for deeper paths, projects or feedback

PARTNERS

Possible packages for schools or organisations

Validate willingness to pay before choosing prices. Keep a useful free path while testing paid features.

Find the first learners before scaling

Start with direct conversations and a small pilot; use evidence to decide where to grow.

- Reach out to student and digital-skills communities.
- Offer a small pilot learning path and invite feedback.
- Share learner projects and useful short learning content.
- Track sign-ups, lesson completion, return visits and feedback.

FIRST 30 DAYS

10–15 learner interviews

1 focused learning path

A small feedback-led pilot

Support to validate and build the first version

Be specific about the help you need. Replace the placeholders with a realistic request before presenting.

THE ASK

Mentorship, pilot access and/or funding

Amount: to be determined from a simple MVP budget.

HOW SUPPORT WILL BE USED

- Build and test a simple prototype
- Create the first practical learning path
- Recruit learners and measure feedback

Before sharing: decide what you are asking for and make sure the request fits the stage of the project.

The people who will make it happen

Keep this slide honest. Add real collaborators only after they have agreed to participate.

P

Phillip

Founder / project lead

Learning programming and web development; leading the concept and early validation.

SKILLS TO ADD AS THE PROJECT GROWS

- Product / learning design
- Software development
- Outreach and learner support

Only list named team members, roles and experience that are accurate.
